## Getting to know each other worksheets

Westend61/Getty Images Learn to draw coordinates on a network often starts in fifth or sixth grade and increases the level of difficulty through to high school and beyond. The grid contains x and y axis, two vertical lines. One trick to remember this (and yes, many students often forget who it is) is to think of y as a longer character and therefore will always be the vertical line on the axis. X is the horizontal line on the axis however, if you have a different trick to remember x and y axis, use what works for you. The point at which axis X and Y axis intersect are referred to as the original point. You'll also see networks referred to as cartesian coordinates. Drawing point numbers are referred to as (3,4) or (2,2) etc. The first number means that you will start on the X axis and move many across, and the second number is the number on the y axis. There are already four quarters on the grid when 0 is the center of the grid. This allows for the drawing of the correct positive and negative numbers. This is just a brief overview of how the cartesian, or the drawing lines on the coordinate worksheets, intersect. With a little practice, you have to understand this concept in no time.
